

POTTERS ARE LEADING SUPPLIERS OF POULTRY EQUIPMENT

There are two main types of automated drinker systems used in poultry - nipple drinkers and bell drinkers. We are able to supply both systems, which are usually kept in stock so are available for fast delivery.

Nipple drinking systems are normally suspended from the ceiling of your poultry building using a winch system. This enables the drinking height of the whole system to be altered very easily. The integrated galvanised perch rail is the strongest of its type, and ensures a long life for the system. We are able to offer completely installed systems fitted by our expert fitting teams.

Please contact us to discuss the best layout for your proposed system. We can advise you on the quantity you require and the best layout.
